DATE MAILED: 03/02/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 10/074,736	Applicant(s) ROBERTSON ET AL. <i>ab</i>	
	Examiner Colleen P Cooke	Art Unit 1754	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 22 December 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-6 and 8-23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-6 and 8-23 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-6 are rejected under 35 U.S.C. 102(b) as being anticipated by Bogard et al. (5205465).

Bogard et al. teaches a method for repair of gas turbine engine rotor components which are wrought nickel-base superalloys or titanium alloys (Column 2, lines 24-27). Bogard et al. also broadly teaches that to perform the repair, the replacement material is placed in an appropriate location to repair the defect by forge joining (Column 4, lines 11-13), and the components are heated and pressed (Column 4, lines 38-41) until a bond is achieved (Column 4, lines 46-47). Bogard et al. goes on to further teach, regarding the heating portion of the forge joining, that the components are heated by such means as an induction coil (38 in Figure 7) and also, as seen in claim 1 that the heating required is a local heating process (section e). The applicant has provided no specific definition of the “direct” heating claimed in the process, yet as the induction heating taught by Bogard et al. provides focused heating energy on the specific part it is deemed to be direct heating.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 1754

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 8-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bogard et al. (5205465) in view of Robertson et al. (5272809).

With respect to claims 8-9, 12-14, and 23, Bogard et al. teaches a method for repair of gas turbine engine rotor components which are wrought nickel-base superalloys or titanium alloys (Column 2, lines 24-27). Bogard et al. also broadly teaches that to perform the repair, the replacement material is placed in an appropriate location to repair the defect by forge joining (Column 4, lines 11-13), and the components are heated and pressed (Column 4, lines 38-41) until a bond is achieved (Column 4, lines 46-47). Bogard et al. goes on to further teach, regarding the heating portion of the forge joining, that the components are heated by such means as an induction coil (38 in Figure 7) and also, as seen in claim 1 that the heating required is a local heating process (section e). Bogard et al. does not teach using resistance heating for the forge joining process.

Robertson et al. teaches a forge joining repair process for gas turbine engine components, including those of the superalloy materials claimed (Column 4, lines 15-23). Robertson et al. further teaches in a specific example that resistance heating is used during the forge joining process (Column 7, lines 23-28). Resistance heating would inherently, by definition, require an electric current to run across the areas heated.

It would have been obvious to modify the forge joining repair process of Bogard et al. by using a resistance heating means as opposed to an induction heating means because Robertson et al. teaches the resistance heating means is used in a forge joining repair process successfully to

Art Unit: 1754

achieve the same temperatures that Bogard et al. requires, as seen when comparing Column 5, lines 51-58 of Bogard et al. with Column 6, lines 52-55 of Roberston et al. which both detail the desired bonding temperatures for the claimed materials of wrought nickel-based superalloys or titanium alloys.

With respect to claims 10 and 11, Bogard et al. teaches machining to form a “contact area” to which the repair may be attached (Column 3, lines 61-65).

Art Unit: 1754

With respect to claims 15-16 and 18-20, Bogard et al. teaches a method for repair of gas turbine engine rotor components which are wrought nickel-base superalloys or titanium alloys (Column 2, lines 24-27). Bogard et al. also broadly teaches that to perform the repair, the replacement material is placed in an appropriate location to repair the defect by forge joining (Column 4, lines 11-13), and the components are heated and pressed (Column 4, lines 38-41) until a bond is achieved (Column 4, lines 46-47). Bogard et al. goes on to further teach, regarding the heating portion of the forge joining, that the components are heated by such means as an induction coil (38 in Figure 7) and also, as seen in claim 1 that the heating required is a local heating process (section e). The applicant has provided no specific definition of the "direct" heating claimed in the process, yet as the induction heating taught by Bogard et al. provides focused heating energy on the specific part it is deemed to be direct heating. Bogard et al. does not teach that the repair process is specifically drawn to lugs or slots of a rotating disk or drum rotor.

Robertson et al. teaches a forge joining repair process for gas turbine engine components, including those of the superalloy materials claimed (Column 4, lines 15-23). Robertson et al. further teaches that the method is used to repair or replace lugs (Column 3, lines 3-9).

It would have been obvious to modify the forge joining repair process of Bogard et al. by applying it to lugs or a turbine engine in need of repair because Robertson et al. teaches that a forge joining repair process is used to successfully repair these components and Bogard et al. teaches a forge joining repair process for any variety of turbine engine components and is not restricted to the illustrative examples only (Column 3, lines 19-22).

With respect to claim 17, Bogard et al. teaches machining to form a "contact area" to which the repair may be attached (Column 3, lines 61-65).

With respect to claims 21-22, Bogard et al. teaches the forge joining repair process as described with respect to claim 1 above. Bogard et al. does not teach Bogard et al. does not teach using resistance heating for the forge joining process.

Robertson et al. teaches a forge joining repair process for gas turbine engine components, including those of the superalloy materials claimed (Column 4, lines 15-23). Robertson et al. further teaches in a specific example that resistance heating is used during the forge joining process (Column 7, lines 23-28). Resistance heating would inherently, by definition, require an electric current to run across the areas heated.

It would have been obvious to modify the forge joining repair process of Bogard et al. by using a resistance heating means as opposed to an induction heating means because Robertson et al. teaches the resistance heating means is used in a forge joining repair process successfully to achieve the same temperatures that Bogard et al. requires, as seen when comparing Column 5, lines 51-58 of Bogard et al. with Column 6, lines 52-55 of Robertson et al. which both detail the desired bonding temperatures for the claimed materials of wrought nickel-based superalloys or titanium alloys.

Response to Arguments

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the

Art Unit: 1754

teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, the applicant argues that motivation must be found in the prior art, however, the applicant is reminded that such motivation may be found "either in the references themselves or in the knowledge generally available to one of ordinary skill in the art". In addition, motivation has been supplied in the rejection itself, taken from each of the references, and the applicant has not specifically argued this motivation.

The applicant also broadly alleges that the prior office action failed to establish a reasonable expectation of success. The rejection itself sets forth the basis for an expectation of success and the applicant has provided no specific argument nor any specific grounds that success would not reasonably be expected. Absent any such arguments or evidence, the reasonable expectation of success is maintained.

Conclusion

Any inquiry concerning this or earlier communications from the examiner should be directed to Colleen Cooke, whose telephone number is 571-272-1170. She can normally be reached Monday-Thursday from 7:15-5:45pm.

If attempts to reach the examiner by telephone are unsuccessful, her supervisor, Stan Silverman, can be reached at 571-272-1358. The official fax number for the organization where

Application/Control Number: 10/074,736

Page 8

Art Unit: 1754

this application or proceeding is assigned is 703-872-9306. The unofficial fax number for this examiner is 703-746-3048.

Any inquiry of a general nature relating to the status of this application or proceeding should be directed to the receptionist, whose telephone number is 703-308-0661.
